

CAutomation Project Client Contract

Project-level business contract for the CAutomation platform

Status: Project-level contract template for CAutomation. This document defines platform-wide business scope and rules. Module-specific details belong in module-level contracts.

1. Document Purpose

This contract describes what the CAutomation platform shall deliver from a business and product perspective. It is intended for product owners, architects, project managers, clients, reviewers, and downstream AI generation workflows.

- Define platform-wide business goals, concepts, rules, workflows, and acceptance criteria.
- Avoid implementation details such as frameworks, database schemas, DTOs, endpoints, or code structure.
- Act as the business source of truth inherited by every CAutomation module.

2. CAutomation Platform Vision

CAutomation is a contract-driven web application platform and AI Engine reference project. It manages human-authored contracts, executes generation pipelines, validates outputs, and produces traceable deliverables for software projects.

- Turn approved business and engineering contracts into controlled AI-generation inputs.
- Reduce ambiguity by making contracts, pipelines, reports, and deliverables explicit.
- Support multi-client, multi-project, multi-module delivery without mixing ownership, visibility, or responsibility.
- Provide an auditable path from source contracts to generated application artifacts.

3. Stakeholders

Stakeholder	Business responsibility
Platform Owner	Owns the CAutomation platform, product direction, global rules, and platform governance.
Client Administrator	Manages a client account, client users, client projects, and client-level access.
Client User	Works inside authorized client projects and modules.
Project Owner	Owns project contracts, module scope, approvals, and deliverable acceptance.
Project Member	Contributes to project contracts, reviews outputs, and follows assigned permissions.
AI Engine	Consumes approved inputs and produces normalized context, generated artifacts, validation results, and reports.
System Administrator	Maintains platform operation, configuration, backups, and technical administration.

4. Platform Concepts

Concept	Business meaning
Client	An organization or customer using CAutomation.
Project	A client-owned delivery context containing contracts, modules, executions, reports, and deliverables.
Module	A functional area within a project, such as Pipeline Management or User & Client Management.
Contract	A human-authored source document that defines business or engineering expectations.

Pipeline	A controlled sequence of tasks executed by the AI Engine.
Execution	A single run of a pipeline or task with inputs, outputs, status, and report evidence.
Deliverable	A generated or curated output intended for review, approval, export, or implementation.
Report	A structured record of validation, execution, or generation outcomes.
Role	A permission grouping that controls visibility and actions.

5. Platform Modules

CAutomation is a multi-module platform. Project-level contracts define shared platform behavior; module-level contracts define individual module scope.

Module	Business responsibility
Pipeline Management	Pipeline creation, configuration, execution, orchestration, monitoring, status, history, and reports.
User & Client Management	Authentication, authorization, platform owners, client users, client management, project creation, project ownership, role-based access, project visibility, and deliverable visibility.

6. Cross-Module Business Rules

- Users belong to clients or platform-level administration contexts.
- Projects belong to clients and must not be visible across clients unless explicitly authorized.
- Modules belong to projects and inherit project ownership and visibility rules.
- Pipelines execute inside projects and may consume project-level and module-level contracts.
- Deliverables belong to projects and may be scoped to modules.
- Permissions must apply consistently across modules.
- A module may depend on platform-wide concepts, but must not redefine them.

7. Platform Workflows

- Client onboarding: create client, assign client administrators, configure visibility and ownership.
- Project creation: create project under a client, assign project owner, select modules, and register contracts.
- Contract authoring: humans create and approve project-level and module-level contracts.
- Pipeline execution: authorized users run pipeline tasks against approved contracts.
- AI generation: normalized inputs are used to generate controlled artifacts.
- Review and approval: users review reports and deliverables before acceptance.
- Export: approved deliverables are packaged for downstream use.

8. Business Quality Requirements

- Traceability: every generated artifact must be traceable to source contracts and pipeline executions.
- Auditability: execution history, validation decisions, and reports must be retained.
- Usability: business users must be able to understand status, errors, and required actions.
- Reliability: failed inputs must be rejected early and clearly.
- Maintainability: modules must be understandable and separable.
- Security: users must see and act only within authorized clients, projects, modules, and deliverables.

9. Constraints and Assumptions

- Human-authored contracts are the source of truth.
- AI must not invent requirements, entities, permissions, workflows, or deliverables.
- Insufficient, contradictory, or ambiguous inputs must be surfaced as validation issues.
- PDF is the primary supported source-document format for the current phase.
- DOCX may remain supported where already implemented, but PDF receives primary engineering and test attention.
- Project-level contracts govern the whole platform; module-level contracts must not override them silently.

10. Acceptance Criteria

- CAutomation supports multiple clients, projects, modules, contracts, pipelines, executions, reports, and deliverables.
- Project-level and module-level contracts remain explicitly separated.
- Pipeline Management and User & Client Management are represented as reference modules.
- Users can understand what is owned by the platform, a client, a project, and a module.
- Downstream AI pipelines can determine which business rules are platform-wide and which are module-specific.

11. Glossary

The terms Client, Project, Module, Contract, Pipeline, Execution, Deliverable, Report, User, and Role are authoritative platform business terms. Module-level documents may use these terms but must not redefine them inconsistently.
