

Project Engineering Contract

Purpose: This Project Engineering Contract defines the engineering contract for CAutomation, CCore, and the Pipeline Management reference module.

Architecture: Pipeline 01 owns context engineering. Task 02 is the single normalization layer and the hard minimum input-quality gate before AI usage. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module.

Engineering Rules: The workflow specification is the architectural contract. Implementation, configuration, tests, documentation, manifests, and reports must stay synchronized. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module.

Traceability: The Project Engineering Contract references the Project Client Contract and constrains how project-level and module-level source documents become canonical normalized input.

Validation: Task 02 validates structural completeness, supported source format, readability, non-empty extracted content, required terms, placeholder tokens, and cross-document references.

Testing: Unit, functional, and validation tests must exercise the PDF-first path. DOCX support remains available as an existing normalizer but should not block progress in this iteration.

Pipeline Contract: Downstream Pipeline 01 tasks and later pipelines consume normalized Markdown and metadata only. They must remain independent of PDF, DOCX, or any future raw source format.

Database and API downstream concerns belong to module-level ATS and later generation pipelines; Task 02 only proves trusted normalized input readiness. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module. Database and API downstream concerns belong to module-level ATS and later generation pipelines; Task 02 only proves trusted normalized input readiness. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module. Database and API downstream concerns belong to module-level ATS and later generation pipelines; Task 02 only proves trusted normalized input readiness. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module. Database and API downstream concerns belong to module-level ATS and later generation pipelines; Task 02 only proves trusted normalized input readiness. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module. Database and API downstream concerns belong to module-level ATS and later generation pipelines; Task 02 only proves trusted normalized input readiness. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module.
