

Project Client Contract

Purpose: This Project Client Contract defines the client intent for the CAutomation project and the Pipeline Management reference module. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module.

Scope: The project covers the CAutomation AI Engine first deliverable. Pipeline Management is the reference project and module used to prove the workflow. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module.

Business Context: The objective is to convert approved human-authored contracts into deterministic normalized input before any AI generation occurs. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module.

Project and Module Boundaries: CAutomation is the only project. CCore is the target architectural family. Pipeline Management is the only reference module in this iteration.

Acceptance: Task 02 must normalize the Project Client Contract, the Project Engineering Contract, the module SRS, and the module ATS into canonical Markdown. It must reject unreadable, incomplete, unsupported, or placeholder-heavy input before downstream tasks run.

Quality Gate: The Project Client Contract references the Project Engineering Contract for engineering constraints. The module SRS references the ATS for technical design. The normalized output must contain enough metadata for downstream pipelines without requiring the original PDF documents.

PDF First: PDF is the primary source-document format for current CAutomation work. DOCX remains supported by existing normalizers but is not the focus of this iteration. CAutomation and CCore define the current automation hierarchy for the Pipeline Management reference module.
